Diagram Essentials

domain-skills · docs/diagrams-essentials · 2026-11-06

1. The domain folder: six bins and the frame around them

One test sorts every fact: who could make it false? Charter and roles above, exemplars beside, unknowns below.

Screenshot 2026-11-06 132550.png

2. The pipeline: plain English to candidates, bins and roles.md

Write it down in raw/, harvest (Level 0), sort, roles, check (Level 1). Two sentences shown as rows.

```
how to use the domain framework? if say i or other users can capture things like PM miss filing, LP needs
letter; we can only do this narrative sayings. then the domain skill framework can transform plain english
into the 6 bins and rows in roles.md ?

Ran 2 shell commands

Yes. That is the pipeline, and it has run once on your brief (domains\equity-research\). Plain English goes
in as a raw file; skills turn it into candidate lines, then rows.

 1. write it down      domains\equity-research\raw\ir-notes-2026-11.md   (verbatim; a chat needs consent
lines)
       |
 2. harvest (Level 0)  /domain:harvest-doc-level0   a note or document
       |               /domain:harvest-chat-level0  a Teams or email thread
       |               /domain:interview-level0     Claude asks you fixed probes, in chat
       ▼               → candidates\ir-notes-2026-11.md: one line per fact: text · bin · raw path · tag
 3. sort (Level 1)     /domain:sort-level1   places lines into the bin files with IDs; wishes → pains block
 4. roles              /domain:roles-level1  builds roles.md from README roles, PR owners, TL users, pains
 5. check              /domain:check-level1  README counts, unknowns deduped, the cross-bin rules

What the two sentences become:

 "the PM misses filings"            "the LP needs a letter on the house view"
  RO PM · verb read · pain: misses   RO LP · verb ask, read letter · pain: Unknown (ask them)
  EN Filing                          EN Letter, EN House view
  DT filing · source EDGAR · daily   DT election result · source official
  PR read filings · owner PM         PR write letter · owner IR · starts on: quarter end, or an LP ask
     starts on: a filing lands          authority: IR drafts, PM signs → source? → UN
  TL whatever the PM reads them in   EX last quarter's letter (keep structure, change tone)
                                     RU investor communications · source Unknown → UN
```

3. Pains: where a complaint lands, and where the fix goes

A pain is a row on the role map. A wish is a pain too. The product spec measures it and assigns the job.

```
still need to understand, what about PM / research analysts pain points, if i can capture
these, where should these pain points or requirement fit?

They go on the role map, not in a bin. roles.md has one row per role and per verb: job, load,
pain. A pain is domain truth ("too much to read, misses things"). A requirement or wish ("I
want an agent that summarizes filings") is not a fact about the domain, so it is recorded as
a pain on the speaker's role and handed to the product spec. The folder never designs the
fix.

 heard from a PM: "I miss filings because there is too much to read"
        |
        ▼
 roles.md   RO-01 PM · verb: read · job: know what changed · load: daily 2 h
            pain: too much to read, misses filings          ◀── lands here
        |
        |  handed to the product spec
        ▼
 /spec:purpose-level1      the pain becomes a measure: filings missed per week, baseline →
target
 /spec:requirements-level1 the shall statement: the system shall flag new filings on held
names
 /spec:agents-level1       the job becomes an agent row, or stays with the PM
 /spec:autonomy-level1     the tier, starting from the PM's authority on that verb

So: pain in the folder, fix in the spec. The bridge is the role row.
```

4. An LP ask, end to end: roles, the step, the bins it touches

The ask is a 'starts on' of kind a role's ask. Authority on send stays PM signs, never looser.

```
another question for you: if an investor LP for the fund want to understand the houseview and most recent
macro level e.g. the US middle term election result on invested portfolio with the fund. is this a role.md
as well? how to address that if our marketing team capture the client request.

● Yes. The charter already serves the LP ("the PM, and through the PM the fund's investors"), and rule 8 says
  every served person is a row in roles.md. The marketing or IR person who captures the ask is a role too. Both
  are in scope because the question is about the domain's outcome.

   roles.md
   RO-03 LP          verbs: read letter, ask    authority: ask: alone
                     job: understand what changed and why
                     pain: answers come late, in jargon, house view unclear
   RO-05 IR/marketing verbs: capture ask, draft answer, send
                     authority: draft: alone · send: RO-01 PM signs (RU-06)
                     job: every LP ask answered within a day, consistent with the house view
                     pain: house view lives in the PM's head; each answer built from scratch

   the ask itself = a `starts on` of kind "a role's ask"
   RO-03 asks ──▶ PR-09 answer LP ask · owner RO-05
                  reads  KN-02 house view (owner PM, valid: this quarter)
                         DT-11 midterm result (source: official count)
                         EN-06 portfolio, DT-04 exposures by sector
                  writes EN-09 LP note
                  rule   RU-06 investor communications: PM signs, compliance reads, no forecasts as promises
                  tool   TL-05 CRM where marketing logged the ask
                  hands  to RO-01 PM for signature, then RO-05 sends

  Where each piece lands: the house view is knowledge (an expert's judgment, dated, with confidence). The
  election result is data (arrives from outside). The LP note is an entity, with a past letter kept in
  exemplars.md to imitate. The communication rules are rules. The capture in the CRM is a tool row. The
  marketing team's capture goes verbatim into raw/ (email or chat, with consent) and harvest-chat-level0 reads
  it: the ask becomes the step, the complaints become pains.

  What the product spec does with it later: the pain "house view lives in the PM's head" becomes a Purpose
  measure (asks answered within a day) and an agent row: an LP-answer drafter that reads knowledge.md, the
  portfolio and the event, at propose tier, because the IR role's authority on send was "PM signs", never
  looser.
```

5. Starts on: four small views

The line, the five kinds of start, reads versus starts on, domain word to spec trigger to dashboard state.

Screenshot 2026-11-06 131900.png

6. The paper investing loop as a chain of starts

Seven starts: three clocks, one ask, two handoffs, one threshold. Two gates: one in the right, one in the trigger.
